**ABSTRACT**

The present invention in several embodiments is a mobility assessment device which is easy to use and which will aid practitioners in evaluating a patients' mobility. The mobility assessment device of the present invention is preferably constructed from a skid resistant high contrast material that can easily be folded, rolled or stored in a compact space. The mobility assessment device of the present invention may include markings or indicia to aid a patient in properly performing one or several mobility assessment tests. The included indicia may have measurements and other marking for aiding a medical professional in evaluating a patient's mobility.
